EX-1: FORM CREATION USING ZOHO CREATOR

1. Aim

To create and configure a data-entry form using the Zoho Creator low-code platform, with suitable fields, field properties, validation, and form layout for collecting student information.

2. Introduction

2.1 Zoho Creator

Zoho Creator is a low-code application development platform that allows applications to be built using visual components with minimal hand-written code. Forms can be created to collect, store, and manage structured information through a web-based application.

2.2 Form in Zoho Creator

A form is a data-entry component used to collect information from users. In Zoho Creator, fields can be added through a drag-and-drop interface and configured according to the type of data they accept, such as text, number, email, date, phone, choice, and file upload.

3. Objectives

- To understand the purpose and structure of a form in Zoho Creator.
- To create a new form using the visual form builder.
- To add appropriate fields and configure their properties.
- To apply required-field and data-validation settings.
- To test the form by entering sample records and verify successful data storage.

4. Requirements

- Zoho Creator account
- Web browser with internet connection
- A new Zoho Creator application
- Basic knowledge of form fields and data types

5. Form Design

For this exercise, a Student Registration Form is created. The form is designed to capture basic student details and demonstrate commonly used Zoho Creator field types.

S.No.	Field Name	Field Type	Purpose
1	Student Name	Single Line	Stores the student's name
2	Register Number	Single Line	Stores the register/roll number
3	Email	Email	Stores the student's email address
4	Phone Number	Phone	Stores contact number
5	Date of Birth	Date	Stores date of birth
6	Department	Dropdown	Selects the student's department
7	Year	Dropdown	Selects the current year of study

8	Gender	Radio/Dropdown	Captures gender information
9	Address	Multi Line	Stores communication address

6. Procedure

6.1 Sign in to Zoho Creator

Open Zoho Creator in a web browser and sign in using a Zoho account.

6.2 Create a New Application

From the Zoho Creator home page, create a new application. Provide an appropriate application name such as "Student Registration" and open the application builder.

6.3 Create the Form

Choose the option to add a new form. Enter the form name as "Student Registration Form" and open the form builder.

6.4 Add Form Fields

Drag the required field types into the form and give each field a meaningful name. Add Single Line, Email, Phone, Date, Dropdown, Radio/Choice, and Multi Line fields according to the form design.

6.5 Configure Field Properties

Set the field data type, display name, choices, and other available properties. Mark important fields such as Student Name, Register Number, Email, and Department as required where appropriate.

6.6 Configure Validation

Use the field properties to apply suitable validation. For example, the Email field should accept an email-format value and the Phone field should accept a valid contact number.

6.7 Arrange the Form

Organize the fields in a logical order so that the form is easy to understand and complete. Use suitable sections or layout options when required.

6.8 Save and Test

Save the form and open its live/preview view. Enter sample student details and submit the form.

6.9 Verify the Record

Open the form's report/data view and verify that the submitted record has been stored correctly with the entered values.

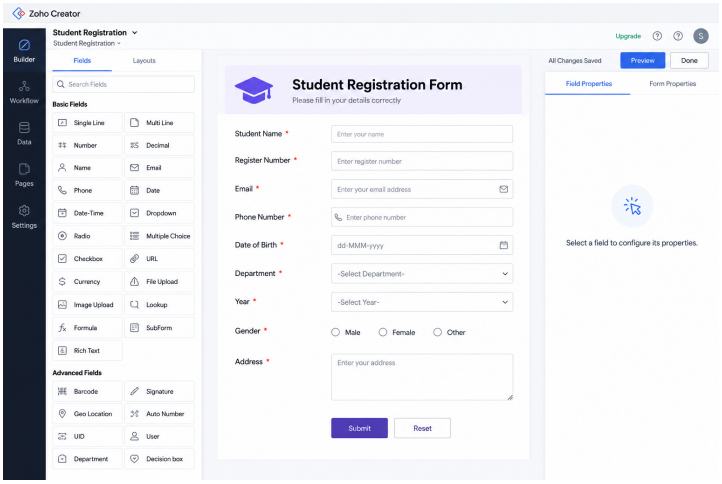

7. Form Creation Workflow

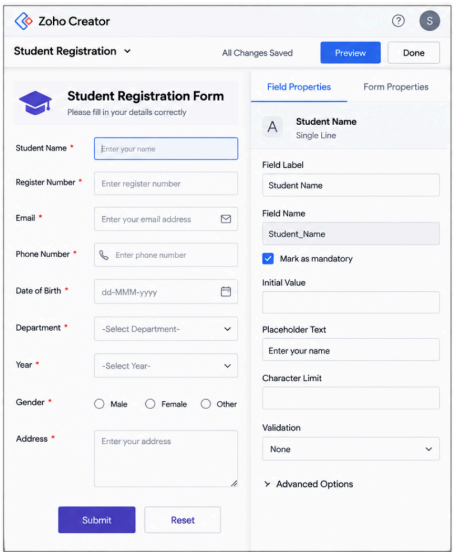

Zoho Creator Login → Create Application → Create Form → Add Fields → Configure Properties → Validate → Save → Test → Verify Record

8. Expected Output

A Student Registration Form is displayed with the configured fields. The user can enter valid student details and submit the form. The submitted information is stored as a record in the Zoho Creator application.

9. Output / Screenshots

10. Result

The Student Registration Form was successfully created using Zoho Creator. The required fields, field properties, validation settings, and form layout were configured, and a sample record was successfully entered and verified.

11. Conclusion

This exercise demonstrates how Zoho Creator can be used to create a functional data-entry form with minimal coding. The visual form builder simplifies field creation, configuration, validation, and record management, making it suitable for rapidly developing business and academic applications.
